## DHIA HERD CODES IMPORTANT IN DHIA RECORD SYSTEM

DHIA Herd Codes are important and necessary to handle DHIA data on either mechanical or electronic computing machines. In some States DHIA month-to-month records are processed in State or Regional Computing Centers. All 305-day lactation records from all States are processed electronically in the Branch to compile DHIA proved-sire records. Therefore, the proper assignment and use of Herd Codes in reporting DHIA records are of fundamental importance to the DHIA recordkeeping program.

DHIA Herd Codes provide the only means of assembling data by herds and relating that data to individual lactation records made in the herd. In compiling proved-sire records in the National Sire-Proving Program in the future, when records of stallmates or contemporaries are compared with the records of individual daughters of a sire, Herd Codes will provide the only means of assembling data to compile proved-sire records with electronic data processing machines.

DHIA Herd Codes provide the only means of group control of data processed in the various State and Regional Computing Centers where electronic computing equipment is used to compile the month-to-month herd reports to DHIA members. Thus, the importance of DHIA Herd Codes in DHIA recordkeeping cannot be over emphasized.

## ESSENTIALS OF THE UNIFORM HERD CODE NUMBERING PLAN

### 1. A DHIA HERD CODE ONCE ASSIGNED MUST NEVER BE REASSIGNED.

Lactation records and yearly reports from individual herds are permanently recorded in the master files of the Branch under the Herd Code for each herd. If a Herd Code should be reassigned, eventually data assembled under the Herd Code will be from two different herds. Herd and contemporary averages from the two herds would be intermixed and not only be worthless but very misleading.

Without exception Herd Codes must not be reassigned.

### 2. CURRENT HERD CODE NUMBER MUST BE USED ON CURRENT LACTATION AND YEARLY HERD REPORTS.

When it is necessary to change a Herd Code because of reorganization of the association or because the herd is moved from one area to another, the new Herd Code number assigned becomes the current herd identification and is used on all current lactation and yearly herd reports.

Without exception the current herd code number must be used on all current reports of data from the herd.

If the above procedures are followed, all data from all herds can be correctly selected and used in various DHIA and proved-sire tabulations.

EACH DHIA SUPERVISOR MUST FOLLOW  
EXPLICITLY THE INSTRUCTIONS HE  
RECEIVES FROM HIS STATE EXTENSION  
DAIRYMAN REGARDING THE REPORTING  
AND USE OF DHIA HERD CODES.

# DHIA PROVED-SIRE RECORDS TABULATED IN MAY 1958

Following is a list of 380 sires whose records were tabulated or retabulated by the Animal Husbandry Research Division in May 1958. Production records used in proving DHIA sires consist of 305-day lactation records standardized to a mature equivalent twice-a-day milking basis.

An asterisk at the end of a sire's registration number indicates a retabulated record. The asterisk may be followed by any number from 1 through 15 (i. e., \*12) to indicate in which of the 15 printed lists his previous record appeared. Or the asterisk may be followed by the month and year (i. e., \*May 51) of the DHIA letter in which his previous record appeared. Two asterisks following the sire's registration number, or following reference to a previous listing, indicate that the proved-sire tabulation or retabulation was requested by one of the States.

In case records from more than one herd were used, the reference is to the herd from which production records for the largest number of the sire's youngest daughters were reported. If the sire has been used in an artificial-breeding association, the name of the association is given.

Proved-sire records consisting of fewer than 10 comparisons are indicated as "preliminary proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

Proved-sire records consisting of fewer than 25 comparisons with daughters resulting from artificial breeding are indicated as "preliminary AB proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

To make the most intelligent selection of a sire, the dairyman should use these proved-sire records to single out the most promising sire and then make every effort to supplement these data with additional information gathered from the herds in which the dams and daughters made their records. Particular attention should be given to the feeding practices and environmental conditions under which the records were made, in order to be assured that the records of the daughters were not made under more favorable conditions than those of the dams or vice versa. It is especially important to determine that there has been no selection of daughters in making the comparison.

| AYRSHIRE SIRES                               | Animals      | Records averaged | Milk   | Test | Fat |
